

Electric motors make an average **70%** of total power cost*

\$87k/hr

Average cost of unplanned downtime for a typical industrial processing plant**

Multiple suppliers, designs and specifications tying up resources.

Frequent unplanned maintenance disrupting operations requiring replacement motors onsite.

Older low efficient motors eating profits.

^{**} https://iac.university/technicalDocs/prodman.pdf (Page 67)

\$930k/yr

Energy savings uncovered during a plant motor audit***

Frame agreements increase supply and specification efficiency freeing up resources.

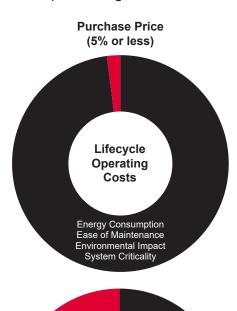

Less unplanned maintenance and downtime with more robust motor designs.

+1% energy efficiency gains translate to less than a two year payback.

^{***} Large pulp and paper producer motor audit results 2014

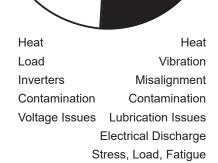

Consider Lifecycle Operating Costs First

The initial cost of an electric motor makes up 5% or less of the total cost of operation. So all aspects of the motor operation should be considered when purchasing motors.

Bearings

Engineered to Address the Common Causes of Motor **Failure**

Engineering Requirements

Each petroleum, chemical, power generation, pulp/paper, mining, metal, mineral, water/wastewater, and general process application has unique torque, speed, voltage, enclosure, temperature, and industry standard requirements that must be designed into motors.

Crushers

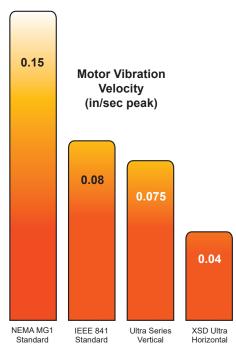

Augers

Heat **Exchangers**

We also have the expertise to diagnose the mechanical and electrical requirements for special applications and custom engineer designs as they warrant.

Low Vibration Means Long Life

Vibration is bad for motors and driven equipment. Motor bearings, in particular, begin to wear faster with high vibration levels. Beyond focusing on proper alignment, base, and voltage, users should also pay more attention to the design of the motor itself. In most cases, manufacturers are content to simply stay within the NEMA or IEEE standards because many engineers, of course, specify these limits.

It is well documented that motors designed with low vibration have longer bearing life.

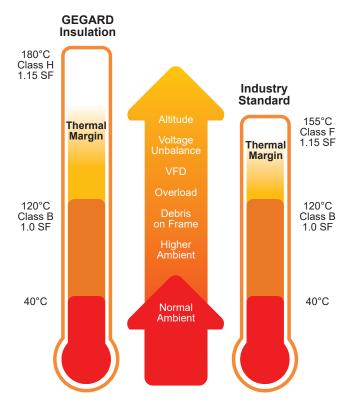

Since bearing wear is one of the leading causes of motor failure, reducing its chances reduces your unplanned downtime. Our application engineers have been told by many users that their driven equipment tends to run smoother with low vibration motors. All of this leads to lower maintenance costs on the entire drive system.

GEGARD™ Insulation offers added protection in severe applications.

Our Class H GEGARD insulation system is designed to excel in variable frequency drive applications where lesser designs often short circuit and cause overcurrent trips.

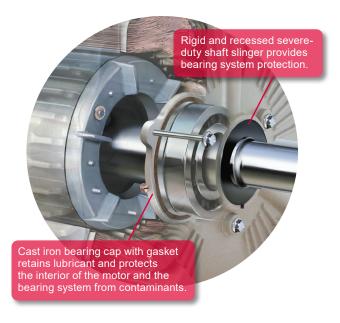

Larger Thermal Margin = Longer Motor Life

Guarding Against Bearing Failure

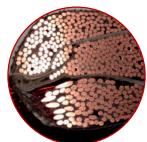

The harmonics from the drives induce a voltage on the shaft. This voltage will discharge through the bearings if the voltage is not grounded. Insulating one bearing prevents a ground loop from developing. We include bearing insulation

for higher rating and Aegis shaft grounding rings are optional on all ratings.

Rotational Varnish Application

Motor coils are rotationally varnished with a "Trickle Treat" process while an electric current is passed through the windings to ensure a penetrating, thorough and even coating. This proven process fills air gaps that could cause corona inception damage during operation.

Wire Bonding

Resin penetrates deep into tightly packed coil wire creating a strong bond that guards against end-turn vibration.

Moisture Protection

Contaminants can't penetrate carefully and tightly packed stator coils bonded by deep resin penetration into the slots.

Severe Duty NEMA IE3

Severe Duty IEC IE3

Energy Saver XP NEMA

Adjustable Speed NFMA

NEMA Premium Efficient

This versatile and robust design is ideal for a wide range of challenging industrial applications and environments.

MODELS

- XSD Ultra
- XSD Ultra 841

Rugged and Reliable

Based on the X\$D Ultra mechanical and electrical design for the global market. Ideal for extreme environments.

MODEL

XSD Ultra 841 IEC

Protects Systems in Hazardous Zones

This enclosure has been specially designed to contain any sparking for hazardous environments where volatile gases may be present.

MODEL

- Energy Saver XP
- · Energy Saver

Excels in Constant Torque Applications

Optimized performance in metal processing, plastic extrusion, winders, test stands, crane and hoist and material handling.

MODEL
